

- We will use the encoder interface available in the V0 Release for the following operations:
 1. As literature searcher, **enter new paper** to be encoded into system
 2. As encoder, **enter a new measurement** into an existing data block
 3. As encoder, enter a measurement into a datablock that doesn't exist yet (must first **create decay mode and branching ratio datablock**)
 4. As overseer **check and signoff on the new encoding**

Once user testing and debugging have been completed, the functionality of the alpha release of the encoder interface available in the V0 Release system will already be sufficient to **do the majority of all PDG encodings**
